Network Assessment

The Logicalis Network Assessment delivers an agentless full-stack hybrid IT discovery solution that provides an in-depth analysis of your IT environment for greater peace of mind.

Overview

Today's organizations face increasingly complex challenges with their IT infrastructure. What were once high-performing networks are now unwieldy behemoths fraught with performance lags and component failures.

In fact, 77% of organizations operate with limited cybersecurity and resilience and “may not even have a clear picture of what and where their most critical information and assets are—nor have adequate safeguards to protect these assets.”¹

And then disaster strikes. The failure is often major—a device failure, or worse—resulting in costly downtime and forcing you to scramble to figure out what happened, where and why. Without visibility into what's on your network, it's hard to optimize performance, manage device lifecycles, or avoid a security incident—let alone align your infrastructure with business goals.

The answer? Audit your network to uncover hidden devices and remediate issues before disaster strikes. The answer is a thorough network assessment.

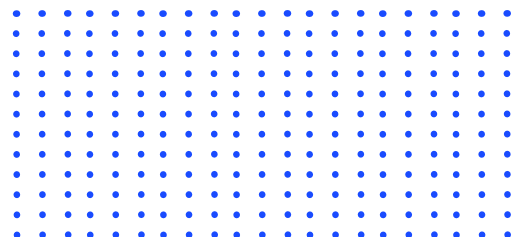

Agentless, full-stack hybrid IT discovery for greater peace of mind

The Logicalis Network Assessment delivers an advanced, agentless full-stack hybrid IT discovery solution that provides an in-depth analysis of your IT environment, including Device Inventory, Device Lifecycle, and Infrastructure Topology Mapping, along with a variety of relevant network telemetry.

This easily installed appliance goes deep to mine detailed information that serves as a baseline of what's going on in your infrastructure. It discovers hidden assets, uncovers gaps, and determines whether the logical network configuration is out of compliance with your defined standards. With total visibility into your network, you can manage your infrastructure to support your business goals—and achieve greater peace of mind. Extending security to your remote workforce.

Why perform a thorough network assessment?

- Address changes in resources, staffing, network topology, or management
- Cleanly integrate (or separate) assets related to mergers, acquisitions, or divestitures
- Bring assets associated with shadow IT back under IT control
- Have more detailed information about your network and its attributes
- Better manage the lifecycles of all your devices
- Provide actionable intelligence to align your actual configuration with the expected configuration

Know what you have to better manage your growth

Even though it evaluates your technology, the Network Assessment is less a technology exercise and more a business requirement. With a comprehensive view and current state of your existing network and by identifying opportunities for improvement, the Network Assessment ensures that your infrastructure is truly aligned with business goals. Plus, it enables you to make more informed business decisions and better drive business growth.

Benefits

- **Increased productivity** – Eliminate hours (or days or weeks) of having critical IT talent spend time to manually inventory your infrastructure.
- **Wide visibility** – Uncover shadow IT and other unmanaged assets that may be impacting your ability to optimize operations.
- **Flexible licensing** – Perform a one-time project-based discovery or consider an annual subscription for continuous discovery and reporting.
- **Continuous discovery** – Keep your infrastructure up to date and have a single source of truth with continuous discovery of assets and gaps.
- **Better insights** – Get complete insight into your infrastructure to make more strategic business decisions and better manage future growth.

Case in Point:

- **Customer:** One of North America's largest and most modern production heat treatment companies
- **Challenge:** Needed to better understand why their infrastructure wasn't meeting business needs.
- **Solution:** The Logicalis Network Assessment uncovered 75 devices in two locations, with some well past end of life as well as some unmanaged network switches. The Security Maturity Survey also found that their firewalls and switching and routing protocols lacked redundancy.
- **Results:** To better support the client's business, Logicalis recommended updating their network infrastructure and security posture. Today, this customer has stronger safeguards in place and complete visibility into their environment, enabling them to grow their business with confidence.

The Logicalis Network Assessment includes:

- Detailed information (S/N, OS version, CPU, switch port, IPAM, and other details as well as virtualization inventory/density, disk inventory/utilization, and much more) on all discovered devices
- Detailed report with findings and recommendations
- Rough order of magnitude (ROM) of products and services that will align your current network to best practices
- Network topology diagram
- Final results presented to your team with deliverables
- The Logicalis Security Maturity Benchmark Survey

Services

In addition to the Network Assessment, Logicalis offers complete professional, consulting, advisory and managed services for network infrastructures, including:

- Professional & Consulting Services
- Design, Integration & Deployment
- Workload Migration
- DevOps & Automation
- Managed Services
- Service Desk
